

AMENDMENT TO SPECIFICATION

Replace the last paragraph of Page 9 with the following paragraph:

--A metal block 110 having six opposed sides is affixed to one of the side walls ~~sides~~
102. The block 110 is angularly oriented in accordance with the slope of the truss so that the
generally vertical securement rod (not shown) can be attached to threaded hole 112 provided
through the block 110, which hole 112 is also in generally vertical alignment due to the angular
orientation of the block 110 on the sidewall 102. The hole 112 is offset from the truss so that the
vertical rod does not need to extend through the truss. The bracket 100 is arranged to support
and secure a truss under high wind conditions in a similar manner as described in connection
with the foregoing embodiments of Figs. 1-10.--
